

Skog Getting Started - Version 1.0

Introduction

Thank you for choosing **Skog**.

This pack includes trees, bushes, rocks, mushrooms and more to help you quickly populate your Unity scenes with foliage.

All foliage assets are **tintable**, enabling hundreds of variations from a small core set. The included shaders support:

- Wind animation
- Splatmap tinting
- Random per-instance tinting
- Slope-based effects for adding snow or moss

Most assets include **LODs and billboards**. All foliage uses **one material per object** and is **GPU Instancing-compatible** for high performance.

Skog is built for the **Universal Render Pipeline (URP)**. **HDRP** and **Built-in** are not supported.

Package Contents

Includes:

- **Trees**

- 2 Conifers + LODs & Billboard
- 1 Birch + LODs & Billboard
- 1 Maple + LODs & Billboard
- **Smaller Foliage**
 - 1 Juniper + LODs & Billboard
 - 1 Bush + LODs & Billboard
 - 1 Fern + LODs
 - 1 Flower + LODs
 - 1 Grass Clump + Grass Texture for Unity Terrain Grass
- **Props**
 - 2 Mushrooms + LODs
 - 4 Rocks + LODs
- **Extras**
 - 2 Particle Systems
 - 3 Individual Leaf Materials for Particles
 - 1 Ground Grass Texture + Normal Map
 - GPUInstancingDemo script
 - 4 Demo Scenes

Installation

Unity Version

- **Unity 6 / 2023 LTS or later**
- **Render Pipeline:** Universal Render Pipeline (URP)

Make sure your project is set up for URP before importing. (Use Project Settings → Graphics and assign a URP Render Pipeline Asset.)

How To Install

- Open your Unity URP project.
- Drag the .unitypackage file into the Project window.
- When prompted, click **Import** and include all recommended assets.

Quick Start Guide

Placing Assets by Hand

1. Drag a prefab into your scene from Skog/Prefabs/[Asset Folder] (e.g. Birch, Conifers, Rocks).

Placing Assets using Unity Terrain

Trees

1. Select your Terrain.
2. Open **Paint Trees**.
3. Click **Edit Trees** → **Add Tree**.
4. Drag a tree prefab from Skog/Prefabs/[Tree Folder] into the Tree slot.
5. Paint trees onto your terrain.

Grass

1. Select your Terrain.
2. Open **Paint Details** / grass tool.
3. Click **Add Grass Texture** (or **Add Detail** depending on Unity version).
4. Use the grass texture at: Skog/Prefabs/Grass/Textures/Grass_Card.
5. Adjust density and size, then paint grass onto your terrain.

Making Your Own Custom Prefab Variations

Example: Birch tree

1. Go to Skog/Prefabs/Birch.
2. Right-click the Birch prefab → **Create** → **Prefab Variant**.
3. Go to Skog/Prefabs/Birch/Materials.
4. Right-click the **Birch** material → **Create** → **Material Variant**.
5. Repeat step 4 for the **Birch_Billboard** material.
6. Double-click your **Birch Prefab Variant** to open it.
7. In the Hierarchy, select LOD0 and assign your **Birch Material Variant** to the Mesh Renderer.
8. Repeat for LOD1.
9. Select the **Billboard** object and assign your **Billboard Material Variant**.
10. Now adjust the tint on your **Birch Material Variant**.
11. Copy the same tint values to the **Billboard Material Variant** so the LODs match.

Performance Tips

- All provided materials have **Enable GPU Instancing** turned on.
- If you prefer **Static Batching**, disable instancing on the materials you use.
- Use the included **LODs** for best performance; keep the highest-detail LODs close to the camera only.

Troubleshooting

- ***Foliage looks too bright or dark***

Check if your material has translucency or random tinting enabled. Disable these features temporarily to see if it fixes the issue.

- ***Wind isn't working***

Make sure you have assigned a grayscale wind texture to your material, and your model has non-black vertex colors. Also make sure you have set a non-zero wind speed and wind strength.
